

RESOURCE HANDOUT REVIEW

Generative AI for Business Leaders & C-Suite | Implementation Resources

1. From Learning to Doing — Your Implementation Toolkit

This course includes seven downloadable resources designed as working tools, not reference documents. The distinction matters. A reference document gets saved to a folder and forgotten. A working tool gets opened, customised, and used to drive decisions. Every resource described here was selected because it addresses a specific implementation barrier that organisations encounter in the first 90 days of AI adoption. Together, they form a complete implementation toolkit — from planning and budgeting to policy-setting and ongoing learning.

Key Point: Open the 90-Day Implementation Template and the ROI Calculator this week. These two resources have the highest immediate impact — the template structures your first 90 days and the calculator builds the business case you need for budget approval. Resources that stay in a downloads folder deliver zero value.

2. Resource 1 — The 90-Day Implementation Template

This Excel-based template provides a week-by-week project plan spanning 13 weeks (approximately 90 days). Each week includes specific tasks, designated owners, milestones, and status tracking columns. The template is structured in four phases, mirroring the 4-Phase AI Adoption Framework covered earlier in the course.

Phase	Weeks	Focus Areas	Key Milestones
Phase 1: Discovery	1-3	Stakeholder alignment, use case identification, governance setup	AI sponsor confirmed, governance group formed, 3-5 use cases shortlisted
Phase 2: Pilot	4-8	Tool provisioning, pilot execution, initial training	Pilot launched, first results measured, usage policy published
Phase 3: Evaluate	9-10	Results analysis, ROI measurement, lessons learned	Pilot ROI calculated, success/failure documented, scale decision made
Phase 4: Scale	11-13	Broader rollout planning, training expansion, governance refinement	Scale plan approved, Phase 2 budget secured, training calendar set

How to Customise It

Download the template and make three immediate modifications. First, replace the generic task descriptions with your organisation's specific context — name the actual departments, the real stakeholders, and the specific use cases you identified during the course. Second, assign actual owners to every task. A task without an owner is a task that will not happen. Third, set realistic dates based on your

organisation's decision-making cadence. If your company requires two weeks for procurement approvals, build that into the timeline rather than discovering it later.

The most effective way to use this template is as a living document reviewed in biweekly steering committee meetings. Project the spreadsheet during the meeting, update task statuses in real time, and use it to drive accountability. Templates that are reviewed regularly get followed. Templates that are emailed once and never reopened get ignored.

3. Resource 2 — The AI Use Case Library

The Use Case Library is a database containing over 200 AI use cases organised by department (Sales, Marketing, HR, Operations, Finance, Legal, IT, Customer Service) and by industry (Financial Services, Healthcare, Retail, Manufacturing, Professional Services, Technology). Each entry includes a description of the use case, the typical tools used, estimated implementation complexity (low, medium, high), and documented ROI where available.

When to Use It

Open this library during your use case identification workshop — the brainstorming session where your team decides which AI applications to pursue first. The library serves two purposes. It sparks ideas that your team may not have considered (most organisations underestimate the breadth of applicable AI use cases). And it provides benchmarks — knowing that similar companies achieved specific results with a particular use case helps you set realistic expectations and build credible business cases.

A common mistake is treating the library as a prescriptive list. It is not. Your organisation's highest-value use cases depend on your specific pain points, data assets, and strategic priorities. Use the library for inspiration and benchmarking, then filter ruthlessly through the lens of your organisation's unique context.

4. Resource 3 — The ROI Calculator

The ROI Calculator is a customisable spreadsheet where you input your organisation's data — employee count, average salaries, current process times, error rates, customer service volumes — and it calculates projected savings and returns from AI implementation. The calculator produces outputs in three categories: direct cost savings (labour hours reduced, error costs eliminated), revenue impact (faster sales cycles, improved conversion rates), and productivity gains (time freed for higher-value work).

Building a Credible Business Case

The ROI Calculator is your primary tool for securing AI budget from finance and the executive team. CFOs respond to quantified projections backed by assumptions they can interrogate. The calculator makes your assumptions explicit — you input the variables, and the spreadsheet shows the mathematical result. This transparency builds credibility in ways that qualitative arguments ('AI will make us more productive') never can.

Real-World Incident — Klarna's Quantified AI Business Case (2024): When Klarna reported that their AI assistant was doing the work of 700 full-time agents and saving \$40 million annually, the specificity of those numbers made the case undeniable. Your ROI Calculator produces similar specificity for your organisation.

Instead of saying 'AI could save us money in customer service,' you can say 'based on our 15,000 monthly tickets, current \$12 average handling cost, and projected 40% AI resolution rate, we expect \$864,000 in annual savings against a \$72,000 tool investment.'

Run the calculator for your top three use cases and present all three projections to your leadership team. Showing multiple scenarios demonstrates thorough analysis and lets decision-makers choose based on risk appetite and strategic alignment.

5. Resource 4 — The AI Policy Template

The AI Policy Template is a ten-page Word document covering four policy areas: acceptable use (what employees can and cannot do with AI tools), data handling (what data classifications are safe to share with AI systems), governance (who makes AI decisions and how), and incident response (what to do when something goes wrong). The template is designed to be customised, not adopted verbatim. Every organisation has unique regulatory requirements, risk tolerances, and operational contexts that the policy must reflect.

Policy Section	Pages	Key Questions Addressed
Acceptable Use	2-3	Which tools are approved? What tasks can AI assist with? What is prohibited?
Data Handling	2-3	What data can be shared with AI? What classification system applies? How is sensitive data protected?
Governance	2-3	Who approves new AI tools? Who reviews AI outputs? What is the escalation path?
Incident Response	1-2	What constitutes an AI incident? Who is notified? What is the remediation process?

Customisation Priority

Start with the acceptable use and data handling sections — these are the policies employees need before they start using AI tools. Governance and incident response can be refined over the first 30 days. The worst outcome is a perfect policy that arrives three months after employees have already been using AI tools without guidelines. The second-worst outcome is a policy so restrictive that it blocks all meaningful AI usage. Aim for the middle: clear boundaries that enable safe experimentation.

6. Resource 5 — The Vendor Comparison Matrix

The Vendor Comparison Matrix evaluates the top twenty enterprise AI tools across five dimensions: features and capabilities, pricing and licensing models, security and compliance certifications, supported use cases, and integration capabilities. The matrix is structured to support rapid decision-making rather than exhaustive evaluation.

How to Use It Efficiently

Do not read the entire matrix cover to cover. Instead, start with your top two or three use cases (identified through the Use Case Library and your strategic priorities), then look up the tools

recommended for those specific use cases. Compare only the three to four most relevant tools on the dimensions that matter most to your organisation — typically security compliance (non-negotiable), ecosystem integration (critical for adoption), pricing (must fit budget), and capability for your specific use case.

The matrix is a decision-acceleration tool. It compresses weeks of vendor research into hours by pre-evaluating the tools your team would otherwise need to research independently. Update it quarterly as the AI tool market evolves rapidly — a matrix from six months ago may already be outdated on pricing and features.

7. Resource 6 — The Prompt Engineering Quick Guide

The Prompt Engineering Quick Guide is a five-page PDF covering techniques for writing effective AI prompts. It addresses the single biggest determinant of AI tool value: how well people communicate with the tool. Two employees using the same AI platform can get dramatically different results based solely on their prompting skill. The guide covers five core techniques.

Technique	What It Does	Example
Role assignment	Tells the AI to adopt a specific expert perspective	'You are a senior financial analyst reviewing Q3 results...'
Context setting	Provides background information for relevant responses	'Our company is a 200-person SaaS firm. We serve enterprise customers...'
Output specification	Defines the desired format, length, and structure	'Provide a 3-paragraph summary with bullet points for key metrics'
Constraint setting	Establishes boundaries on the response	'Use only data from 2023-2024. Do not include speculative projections'
Iterative refinement	Improves outputs through follow-up instructions	'Make this more concise. Strengthen the opening paragraph. Add a counter-argument'

Distribution Strategy

Share this guide with every employee who has access to an AI tool — not just during initial training, but as an ongoing reference. The most effective distribution method is embedding it into the onboarding flow: when an employee gets their AI platform login, they receive the Prompt Engineering Quick Guide as a required reading attachment. Consider creating an internal Slack or Teams channel where employees share effective prompts, building on the techniques in the guide with organisation-specific examples.

8. Resource 7 — Monthly AI Newsletter Signup

AI evolves faster than any technology domain in history. Tools released six months ago may already be superseded. Pricing models shift quarterly. New capabilities emerge that create use cases nobody anticipated. Staying current is not optional — it is a strategic necessity. The monthly AI newsletter provides curated updates on AI developments, new tool releases, case studies from enterprise deployments, regulatory changes, and best practices. Curated information is exponentially more

valuable than raw news feeds because someone has already filtered for relevance and business applicability.

Beyond the newsletter, build a habit of systematic AI awareness. Designate one member of your AI governance working group as the 'intelligence lead' responsible for monitoring developments, attending vendor briefings, and summarising key changes for the team quarterly. This is a small time investment (two to four hours per month) that prevents the organisation from being blindsided by market shifts.

9. Making Resources Actionable — The First-Week Protocol

Resources convert to value only when they are used. The following protocol ensures that these seven resources translate into action rather than sitting in a downloads folder.

Day	Action	Resource Used	Output
Monday	Open and customise the 90-Day Template	90-Day Implementation Template	Your personalised 13-week project plan
Tuesday	Run ROI projections for top 3 use cases	ROI Calculator	Three quantified business cases for leadership
Wednesday	Browse use cases for your industry/department	AI Use Case Library	Shortlist of 5-8 potential AI applications
Thursday	Draft acceptable-use and data-handling sections	AI Policy Template	Two-page interim AI usage policy
Friday	Evaluate top 3-4 tools for your priority use case	Vendor Comparison Matrix	Recommended tool with rationale
Ongoing	Share with every AI tool user	Prompt Engineering Guide	Higher-quality AI outputs across the team
Monthly	Stay current on AI developments	AI Newsletter	Quarterly briefing for governance group

10. Common Mistakes with Implementation Resources

- **Downloading without opening:** The most common failure. Over 60% of course resources are never opened after download. Set a calendar reminder for Monday morning to open the 90-Day Template and ROI Calculator.
- **Using templates without customisation:** Generic templates produce generic results. Spend the time to replace placeholder text with your actual stakeholders, use cases, and data. Customised resources are used; generic ones are abandoned.
- **Working in isolation:** These resources are designed for collaborative use. The ROI Calculator produces projections to share with finance. The Policy Template needs Legal and IT input. The Implementation Template needs owner names. Share early and often.
- **Treating resources as one-time artifacts:** The Implementation Template should be reviewed biweekly. The Policy Template should be updated monthly. The Vendor Matrix should be refreshed quarterly. Build review cadences into your calendar.

- **Skipping the Prompt Engineering Guide:** Organisations that invest in prompt skills get 3-5x more value from the same AI tools. This five-page guide has a disproportionate impact on AI ROI.

11. Key Terms Glossary

Term	Definition
90-Day Implementation Template	A week-by-week Excel project plan covering the four phases of AI adoption: Discovery, Pilot, Evaluate, and Scale
AI Use Case Library	A database of 200+ AI applications organised by department and industry, used for brainstorming and benchmarking during use-case selection
ROI Calculator	A customisable spreadsheet that converts organisational inputs (headcount, salaries, process times) into projected AI savings and returns
AI Policy Template	A ten-page document covering acceptable use, data handling, governance, and incident response — designed to be customised for each organisation
Vendor Comparison Matrix	A structured evaluation of the top 20 enterprise AI tools across features, pricing, security, use cases, and integration capabilities
Prompt Engineering	The skill of crafting effective instructions for AI tools to produce high-quality, relevant outputs — a primary determinant of AI tool value
Data Classification	A system for categorising organisational data by sensitivity level (public, internal, confidential, restricted) to determine AI sharing permissions

12. Quick Revision Checklist

- Seven resources provided: 90-Day Template, Use Case Library, ROI Calculator, Policy Template, Vendor Matrix, Prompt Guide, Newsletter
- Open the 90-Day Template and ROI Calculator within the first week — they have the highest immediate impact
- Customise every template with your organisation's specific context, stakeholders, and data
- Run ROI projections for your top three use cases to build quantified business cases
- Draft acceptable-use and data-handling policies before deploying AI tools broadly
- Share the Prompt Engineering Guide with every AI tool user — prompting skill determines 3-5x value variation
- Use the Vendor Comparison Matrix to accelerate tool selection, not replace evaluation entirely
- Build review cadences: biweekly for the Implementation Template, monthly for Policy, quarterly for Vendor Matrix
- Resources used collaboratively drive 5-10x more value than resources used in isolation
- Designate an AI intelligence lead to monitor developments via the newsletter and vendor briefings
- Resources that stay in a downloads folder deliver exactly zero value — open them this week

20 Exam-Based MCQs — AI Implementation Resources

Test yourself after reading. These questions are written in real exam style — scenario-heavy, with plausible distractors. Read every explanation, including for questions you answered correctly.

Q1. *Scenario:* A Director downloads all seven course resources on Friday afternoon, saves them to a shared drive, and emails the team: 'Here are some AI resources — take a look when you have time.' Two months later, download analytics show that only 3 of 45 team members opened any file. What was the primary failure in the Director's approach?

- A) The resources were not high enough quality
- B) The shared drive was difficult to access
- C) Resources were distributed passively without structured activation — no specific tasks, deadlines, or accountability for using them
- D) The team was too busy for additional reading

Answer: C **Explanation:** C is correct because passive distribution ('take a look when you have time') generates minimal engagement. Effective resource activation requires specific instructions (open this spreadsheet and fill in columns A-D by Wednesday), designated owners, and follow-up accountability. A is wrong because quality was not the barrier — engagement was. B is wrong because access difficulty is rarely the primary barrier to resource adoption. D is wrong because 'too busy' is a symptom of low prioritisation, which structured activation addresses.

Q2. Which two resources should be opened and worked on within the first week according to the implementation protocol?

- A) The Vendor Comparison Matrix and the AI Newsletter
- B) The 90-Day Implementation Template and the ROI Calculator
- C) The AI Policy Template and the Prompt Engineering Guide
- D) The Use Case Library and the Vendor Comparison Matrix

Answer: B **Explanation:** B is correct because these two resources have the highest immediate impact. The 90-Day Template structures the entire implementation trajectory, and the ROI Calculator builds the quantified business case needed for budget approval. Without a plan and a budget case, all other resources lack a foundation. A is wrong because vendor comparison and newsletters are important but not the immediate priority. C is wrong because while critical, the policy should follow initial planning and the prompt guide follows tool deployment. D is wrong because these are evaluation tools, not planning foundations.

Q3. *Scenario:* A Finance VP reviews the ROI Calculator output showing projected savings of \$1.2 million from AI implementation. She asks: 'What assumptions drive this number? How sensitive is it to changes in adoption rates?' Why is the ROI Calculator designed with explicit, adjustable inputs rather than providing a single projected number?

- A) To make the spreadsheet look more complex and professional

- B) Because transparent assumptions build credibility with finance stakeholders who need to interrogate the logic behind projections before approving budgets
- C) To allow users to inflate projections for better presentations
- D) Because the actual ROI is unknowable and any projection is equally valid

Answer: B **Explanation:** B is correct because CFOs and finance teams evaluate projections by examining underlying assumptions. A calculator that shows its inputs — employee count, average salary, projected time savings, adoption rate — allows decision-makers to stress-test the model by adjusting variables. This builds the credibility needed for budget approval. A is wrong because complexity is not the goal. C is wrong because manipulable inputs serve transparency, not inflation. D is wrong because while projections involve uncertainty, rigorous assumptions produce meaningfully different estimates than arbitrary guesses.

Q4. What is the recommended structure of the 90-Day Implementation Template?

- A) A single list of 90 daily tasks
- B) Four phases — Discovery (weeks 1-3), Pilot (weeks 4-8), Evaluate (weeks 9-10), Scale (weeks 11-13) — with tasks, owners, and milestones per week
- C) A Gantt chart showing only major milestones
- D) A budget spreadsheet with monthly cost projections

Answer: B **Explanation:** B is correct. The template follows the 4-Phase AI Adoption Framework with specific weekly tasks, designated owners, milestones, and status tracking. This structure balances sufficient detail for accountability with enough flexibility to adapt to organisational context. A is wrong because daily task lists are too granular for a strategic implementation plan. C is wrong because a milestone-only view lacks the task-level detail needed for execution. D is wrong because while budgets matter, the template is a project plan, not a financial model.

Q5. *Scenario:* An HR Director uses the AI Policy Template verbatim — copying it directly without changing any section to reflect the company's specific industry, regulatory environment, or existing policies. What is the primary risk of this approach?

- A) Copyright infringement from using the template
- B) The generic policy may not address the organisation's specific regulatory requirements, data sensitivity levels, or operational context — creating gaps that expose the company to risk
- C) Employees will recognise it as a template and lose trust
- D) The policy will be too long for employees to read

Answer: B **Explanation:** B is correct because every organisation operates under unique regulatory requirements (healthcare has HIPAA, finance has SOX, EU companies have GDPR), handles different data sensitivity levels, and has specific operational contexts. A generic policy may approve tools that violate your regulatory requirements or fail to restrict data sharing that your industry prohibits. A is wrong because the template is designed to be used. C is wrong because while credibility matters, the substantive risk is policy gaps. D is wrong because length is not the issue — relevance is.

Q6. How often should the AI Policy Template be reviewed and updated after initial deployment?

- A) Once per year during the annual policy review cycle
- B) Monthly — as AI usage generates real incidents, questions, and edge cases that the initial policy did not anticipate
- C) Only when a major AI incident occurs
- D) Never — the policy should remain stable to avoid confusion

Answer: B **Explanation:** B is correct because AI technology and usage patterns evolve rapidly. Monthly reviews allow the policy to incorporate lessons learned from actual usage — questions employees have raised, edge cases encountered, new tools adopted, and regulatory updates. A is wrong because annual reviews are too slow for a rapidly evolving domain. C is wrong because reactive-only updates miss opportunities to prevent incidents through proactive policy refinement. D is wrong because policy stability in a fast-moving domain creates compliance gaps.

Q7. *Scenario:* During a use case identification workshop, a team brainstorms AI applications without consulting the Use Case Library. They generate eight ideas, all focused on their own department. Later, they discover that the Library contains 15 additional cross-departmental use cases with documented ROI from similar organisations. What value did the team miss by not consulting the library?

- A) The ability to copy competitors' strategies
- B) Benchmarking data from similar organisations and exposure to cross-departmental use cases they would not have independently considered
- C) A guarantee that their selected use cases would succeed
- D) Vendor discounts available only through library-referenced use cases

Answer: B **Explanation:** B is correct because the Use Case Library serves two specific purposes: sparking ideas beyond what a single team would generate (especially cross-departmental applications) and providing ROI benchmarks from documented implementations. Without benchmarks, the team cannot set realistic expectations or build credible business cases. A is wrong because the library provides inspiration, not competitive strategy. C is wrong because no resource guarantees success. D is wrong because vendor discounts are not linked to use case libraries.

Q8. What are the five core prompt engineering techniques covered in the Quick Guide?

- A) Copy, paste, edit, submit, retry
- B) Role assignment, context setting, output specification, constraint setting, and iterative refinement
- C) Short prompts, long prompts, creative prompts, analytical prompts, conversational prompts
- D) Keyword matching, boolean operators, natural language, code syntax, template filling

Answer: B **Explanation:** B is correct. The five techniques are: role assignment (giving the AI an expert perspective), context setting (providing relevant background), output specification (defining desired format and structure), constraint setting (establishing boundaries), and iterative refinement (improving outputs through follow-up). These techniques address the most common reasons for poor AI outputs. A is wrong — these are mechanical actions, not prompting techniques. C is wrong — prompt length is not a technique. D

is wrong — these are search engine techniques, not AI prompting methods.

Q9. Scenario: A company deploys Microsoft Copilot to 200 employees. After 60 days, usage analytics show that 30 employees use it daily, 50 use it weekly, and 120 have not logged in since their initial onboarding session. Which resource would most effectively address the 120 non-adopters?

- A) The Vendor Comparison Matrix — perhaps a different tool would be better
- B) The Prompt Engineering Quick Guide combined with peer learning sessions where the 30 daily users share their workflows and effective prompts
- C) The AI Policy Template — stricter policies would force adoption
- D) The ROI Calculator — showing potential savings would motivate usage

Answer: B Explanation: B is correct because the most common barrier to sustained AI tool adoption is not knowing how to get value from it. The Prompt Engineering Guide teaches foundational skills, and peer learning from colleagues who have found value creates social proof and practical examples relevant to the non-adopters' actual work. A is wrong because tool switching rarely solves adoption problems — the issue is usually skill and habit, not platform. C is wrong because mandated adoption without skill-building creates resentment and superficial compliance. D is wrong because ROI projections do not address the practical barrier of not knowing how to use the tool effectively.

Q10. Why is the Vendor Comparison Matrix recommended to be refreshed quarterly?

- A) To keep the document looking current for auditors
- B) Because the AI tool market evolves rapidly — pricing changes, new features launch, new competitors emerge, and security certifications update on a quarterly cycle
- C) To justify the cost of the matrix subscription
- D) Because vendor contracts renew quarterly

Answer: B Explanation: B is correct because the AI tool market changes faster than any other enterprise technology segment. A matrix from six months ago may show outdated pricing (tools have repriced), missing features (major capabilities added), absent competitors (new entrants like industry-specific AI tools), and outdated security certifications. Quarterly refreshes ensure that tool selection decisions are based on current information. A is wrong because the purpose is decision quality, not compliance optics. C is wrong because the matrix is a course resource, not a subscription. D is wrong because vendor contracts do not universally follow quarterly cycles.

Q11. Scenario: The AI governance working group designates a junior analyst as the 'AI intelligence lead' responsible for monitoring AI developments. The analyst spends 15 hours per week reading AI news, attending vendor webinars, and writing detailed reports that nobody reads. What adjustment would make this role more effective?

- A) Assign a more senior person to the role
- B) Eliminate the role entirely — staying current is not important

- C) Limit the role to two to four hours per month, focused on curating actionable insights for a quarterly briefing to the governance group rather than comprehensive reporting
- D) Outsource AI monitoring to a consulting firm

Answer: C **Explanation:** C is correct because the intelligence lead role should be efficient, not exhaustive. Two to four hours per month of curated, actionable intelligence delivered as a quarterly briefing is far more valuable than 60 hours of detailed reporting that nobody reads. The role should filter for business relevance, not aim for comprehensive coverage. A is wrong because seniority does not solve the over-investment problem. B is wrong because AI awareness is strategically important. D is wrong because internal context is needed to determine what is relevant to your organisation.

Q12. What three immediate modifications should be made when customising the 90-Day Implementation Template?

- A) Change the colours, add the company logo, and adjust font sizes
- B) Replace generic descriptions with organisation-specific context, assign actual owners to every task, and set realistic dates based on your decision-making cadence
- C) Delete all phases and start from scratch
- D) Translate it into multiple languages for global teams

Answer: B **Explanation:** B is correct. The three critical customisations are: specificity (replacing generic placeholders with real departments, stakeholders, and use cases), accountability (assigning named owners to every task), and realism (adjusting timelines to reflect actual organisational processes like procurement cycles and approval workflows). A is wrong because cosmetic changes do not improve the plan's effectiveness. C is wrong because the four-phase structure is proven. D is wrong because translation is a secondary concern after content customisation.

Q13. *Scenario:* A company calculates AI ROI using the ROI Calculator: projected savings of \$800,000 against a \$150,000 annual investment. The CFO approves the budget but asks for a sensitivity analysis. What should the sensitivity analysis examine?

- A) Whether the AI vendor will go out of business
- B) How projected savings change when key assumptions vary — adoption rate drops from 80% to 40%, productivity gain drops from 20% to 10%, or implementation takes six months instead of three
- C) Whether competitors are spending more or less on AI
- D) Historical stock performance of AI companies

Answer: B **Explanation:** B is correct because sensitivity analysis tests how the projected ROI changes when key assumptions are stressed. If the business case remains positive even with halved adoption rates and halved productivity gains, the investment is robust. If it turns negative with modest assumption changes, the case is fragile and requires risk mitigation strategies. A is wrong because vendor viability, while worth assessing, is not a sensitivity analysis. C is wrong because competitor spending does not affect your ROI calculation. D is wrong because stock performance is irrelevant to operational ROI.

Q14. Why does the resource protocol recommend using the Implementation Template as a living document reviewed in biweekly meetings rather than as a one-time planning artifact?

- A) To justify having biweekly meetings
- B) Because regular review drives accountability — tasks with visible status tracking and designated owners get completed at significantly higher rates than tasks on static documents
- C) Because the template needs formatting updates every two weeks
- D) To generate meeting minutes for compliance records

Answer: B **Explanation:** B is correct because the behavioural science behind project management shows that visible accountability (status updates projected in meetings) and regular cadence (biweekly rhythm) dramatically increase task completion rates. A document reviewed regularly becomes a management tool. A document created once becomes a historical artifact. A is wrong because the meetings serve the plan, not the other way around. C is wrong because formatting is irrelevant. D is wrong because compliance documentation is not the primary purpose.

Q15. *Scenario:* An organisation's legal counsel reviews the AI Policy Template and says: 'This is a good starting point, but it does not address our HIPAA obligations for patient data handling.' What does this feedback reveal about proper template usage?

- A) The template is defective and should not be used
- B) The template requires industry-specific customisation — generic policies must be tailored to reflect each organisation's regulatory environment, which is exactly why legal review is built into the process
- C) Healthcare organisations should not use AI
- D) The legal counsel is being overly cautious

Answer: B **Explanation:** B is correct because the template is explicitly designed for customisation. It provides a structural framework that must be adapted to each organisation's regulatory context. A healthcare organisation must add HIPAA-specific provisions, a financial firm must address SOX and SEC requirements, and an EU-based company must align with GDPR. This is expected, not a deficiency. A is wrong because the template works as intended — as a starting point. C is wrong because healthcare organisations can and do use AI successfully. D is wrong because HIPAA compliance is a legal requirement, not an excess of caution.

Q16. What is the recommended distribution strategy for the Prompt Engineering Quick Guide?

- A) Share it only with the IT department
- B) Post it on the company intranet and hope employees find it
- C) Embed it into the AI tool onboarding flow — every employee receives it when they get their platform login, with an internal channel for sharing effective prompts
- D) Hold a one-time company-wide presentation and never reference it again

Answer: C **Explanation:** C is correct because the most effective distribution ties the guide to the moment of need — when an employee first gets access to an AI tool. Embedding it in the onboarding flow ensures every user receives it at the relevant time, and the internal prompt-sharing channel creates ongoing

reinforcement and community learning. A is wrong because all AI tool users need prompting skills, not just IT. B is wrong because passive posting has minimal engagement. D is wrong because one-time exposure does not build lasting skills.

Q17. Scenario: *A company uses the Vendor Comparison Matrix to select an AI customer service tool in January. In July, a new entrant launches with 50% lower pricing and significantly better performance on their specific use case. What does this scenario illustrate about resource maintenance?*

- A) The Vendor Comparison Matrix was a waste of time
- B) Vendor decisions should be delayed indefinitely to avoid missing new entrants
- C) Quarterly matrix refreshes would have identified the new entrant, enabling a timely evaluation — the matrix is a living tool, not a one-time artifact
- D) The company should immediately switch to the new entrant

Answer: C **Explanation:** C is correct because quarterly refreshes (recommended by the protocol) would have caught the new entrant during the Q2 update, enabling an informed evaluation before the July launch. The matrix's value depends on being maintained as a living reference. A is wrong because the January decision was correct with available information — the issue is ongoing maintenance. B is wrong because indefinite delay has higher costs than occasional switching. D is wrong because immediate switching without evaluation is as risky as never re-evaluating.

Q18. Why does the implementation protocol emphasise collaborative use of resources rather than individual use?

- A) To increase meeting frequency
- B) Because resources like the ROI Calculator need Finance input, the Policy Template needs Legal and IT input, and the Implementation Template needs cross-functional owner assignments — individual use misses critical perspectives
- C) To spread the workload evenly across the team
- D) Because collaborative work is always better than individual work

Answer: B **Explanation:** B is correct because each resource requires expertise that no single person possesses. The ROI Calculator produces credible projections only when finance validates the assumptions. The Policy Template covers legal, IT, and HR domains. The Implementation Template requires owners from multiple departments. Individual use produces incomplete, unchallenged outputs that lack organisational buy-in. A is wrong because meetings are the mechanism, not the purpose. C is wrong because workload distribution is a secondary benefit. D is wrong because the principle is not universal — it applies here because the resources specifically require cross-functional input.

Q19. Scenario: *A project manager customises the 90-Day Implementation Template with detailed tasks and milestones but assigns all 47 tasks to themselves rather than distributing ownership. What outcome is most likely?*

- A) The project will succeed because single ownership ensures consistency

- B) The project manager will become a bottleneck — tasks requiring Legal, IT, HR, and business unit expertise will stall because one person lacks the authority and knowledge to execute across all domains
- C) The project will proceed faster due to reduced coordination overhead
- D) Other team members will voluntarily take on tasks without formal assignment

Answer: B **Explanation:** B is correct because AI implementation is inherently cross-functional. Tasks like drafting data handling policies require legal expertise, provisioning tools requires IT authority, and training requires HR coordination. A single person cannot effectively execute across all these domains, creating bottlenecks at every cross-functional boundary. A is wrong because consistency does not compensate for bottlenecks and missing expertise. C is wrong because one person handling 47 tasks is slower, not faster. D is wrong because without formal assignment and accountability, voluntary task adoption rarely occurs at sufficient scale.

Q20. What is the single most important action to take with these seven resources within 48 hours of downloading them?

- A) Read all seven resources thoroughly from start to finish
- B) Share them on social media to demonstrate thought leadership
- C) Open the 90-Day Implementation Template, customise it with your organisation's context, and assign owners to Week 1 tasks — creating irreversible momentum toward execution
- D) Print them all for offline reference

Answer: C **Explanation:** C is correct because the 90-Day Template is the keystone resource — it structures everything else. Customising it with real names, dates, and context transforms it from a template into a commitment. Assigning Week 1 owners creates accountability that makes execution the path of least resistance. A is wrong because thorough reading without action is a form of procrastination. B is wrong because external sharing has zero implementation value. D is wrong because printing does not drive action — opening and customising the template does.
